

UI Policy Configuration – SLA Governance Enforcement

Overview

The **UI Policy** is implemented to enforce SLA governance by dynamically controlling the behavior of fields on the Incident form. When an Incident reaches the defined SLA risk threshold, the **SLA At Risk** field is automatically set to **True** by the Flow Designer workflow. The UI Policy then makes SLA governance fields visible and mandatory, ensuring that users provide the required information before updating or resolving the Incident.

This configuration eliminates manual enforcement and guarantees that every SLA risk is documented consistently, supporting accountability, reporting, and audit readiness.

Purpose

The primary purpose of the UI Policy is to:

- Enforce mandatory SLA governance fields when an Incident is at risk.
 - Ensure users provide an SLA breach reason and justification.
 - Capture user acknowledgement of the SLA warning.
 - Improve accountability and compliance.
 - Standardize SLA breach documentation across all incidents.
 - Support reporting and audit requirements.
-

Navigation

Navigate to the UI Policy configuration page:

System UI → UI Policies

Click **New** to create a new UI Policy.

Step 1: Create UI Policy

Configure the UI Policy with the following details.

Field	Value
Table	Incident

Field	Value
-------	-------

Short Description	SLA Governance – Mandatory Fields
-------------------	-----------------------------------

Active	True
--------	------

Condition	SLA At Risk = True
-----------	--------------------

Click **Submit** to save the UI Policy.

Step 2: Configure UI Policy Actions

After creating the UI Policy, open it and create the following **UI Policy Actions**.

UI Policy Action 1

Property	Value
----------	-------

Field Name	SLA Breach Reason
------------	-------------------

Mandatory	True
-----------	------

Visible	True
---------	------

Read Only	False
-----------	-------

Purpose: Requires the user to select a predefined reason explaining the SLA breach.

UI Policy Action 2

Property	Value
----------	-------

Field Name	SLA Breach Justification
------------	--------------------------

Mandatory	True
-----------	------

Visible	True
---------	------

Read Only	False
-----------	-------

Purpose: Requires the user to enter a detailed justification for the SLA breach.

UI Policy Action 3

Property Value

Field Name SLA Acknowledgement

Mandatory Optional (based on project requirement)

Visible True

Read Only False

Purpose: Allows the assigned user to acknowledge that they are aware of the SLA risk before proceeding.

UI Policy Logic

The UI Policy works as follows:

1. Flow Designer detects that the Task SLA has reached **80%** of its business elapsed time.
2. The Incident record is updated with **SLA At Risk = True**.
3. The UI Policy is triggered automatically.
4. The fields **SLA Breach Reason**, **SLA Breach Justification**, and **SLA Acknowledgement** become visible.
5. The **SLA Breach Reason** and **SLA Breach Justification** fields become mandatory.
6. Users cannot save or resolve the Incident until the required information is entered.

Configuration Summary

UI Policy Condition Action

SLA At Risk = True Trigger UI Policy

Field	Mandatory	Visible
SLA Breach Reason	Yes	Yes
SLA Breach Justification	Yes	Yes
SLA Acknowledgement	No (or Yes if required)	Yes

Validation

After configuration, verify the following:

- The UI Policy is **Active**.
- The policy is applied to the **Incident** table.
- When **SLA At Risk = False**, the governance fields remain hidden or optional according to the form design.
- When **SLA At Risk = True**, the **SLA Breach Reason** and **SLA Breach Justification** fields become mandatory.
- The **SLA Acknowledgement** field becomes visible.
- Users cannot complete the Incident update without entering the required information.

UI Policy Action configuration form. The form is titled "UI Policy Action" with a subtitle "New record". It includes a "Submit" button in the top right corner. The form contains the following fields:

- UI policy: Enforce SLA justification when SLA is at risk, UI
- Table: Incident (incident)
- * Field name: SLA Breach Reason
- Application: Global
- Mandatory: True
- Visible: True
- Read only: Leave alone
- Clear the field value: ☐

Below the form is a "Submit" button.

Expected Outcome

After implementing the UI Policy:

- SLA governance fields appear automatically when an Incident is at risk.
 - Users are required to document the reason and justification for the SLA breach.
 - SLA acknowledgement is captured as part of the governance process.
 - Manual enforcement is eliminated through dynamic form behavior.
 - Incident records contain complete and standardized SLA governance information.
-

Benefits

- Automated enforcement of SLA governance rules.
 - Improved accountability among Incident assignees.
 - Consistent SLA breach documentation.
 - Enhanced compliance with organizational policies.
 - Better quality data for reporting and dashboards.
 - Audit-ready records without additional manual effort.
 - Zero-code implementation using native ServiceNow UI Policies.
-

Conclusion

The **UI Policy Configuration** plays a critical role in the **Virtual Agent–Driven SLA Breach Awareness & Justification System** by dynamically enforcing governance requirements whenever an Incident approaches an SLA breach. By making the **SLA Breach Reason** and **SLA Breach Justification** fields mandatory and displaying the **SLA Acknowledgement** field, the system ensures that all SLA-related incidents are

documented consistently. This configuration strengthens accountability, improves compliance, and supports transparent, audit-ready SLA governance within the ServiceNow platform.
