

Stakeholder Roles and Responsibilities

Description

The successful implementation of the **Virtual Agent–Driven SLA Breach Awareness & Justification System** depends on the collaboration of multiple stakeholders, each with specific responsibilities. Clearly defining these roles ensures effective SLA governance, accountability, secure system administration, and continuous monitoring of service performance.

The primary stakeholders in this project include **IT Support Agents**, **IT Managers**, and the **ServiceNow Administrator**. Each stakeholder contributes to maintaining SLA compliance, improving operational efficiency, and ensuring that the system functions according to organizational governance policies.

1. IT Support Agents

Overview

IT Support Agents are the primary users responsible for resolving incidents within the agreed Service Level Agreements (SLAs). They interact directly with the system whenever an assigned incident approaches an SLA breach.

The system proactively notifies agents of potential SLA risks, enabling them to take corrective action before the SLA expires. Through the ServiceNow Virtual Agent, agents receive guidance, acknowledge SLA risks, and provide the necessary breach documentation.

Responsibilities

- Receive automated SLA warning notifications.
- Monitor assigned incidents for SLA status.
- Interact with the Virtual Agent for SLA awareness.
- Acknowledge SLA risk through the Virtual Agent conversation.
- Submit SLA breach reasons and justifications when required.
- Update incident records with accurate work notes and resolution details.
- Resolve incidents within the defined SLA whenever possible.
- Ensure all mandatory governance fields are completed before closing incidents.

Contribution to the Project

IT Support Agents play a critical role in reducing SLA violations by responding promptly to alerts, documenting the reasons for delays, and maintaining accountability throughout the incident resolution process.

2. IT Managers

Overview

IT Managers oversee the performance of support teams and ensure compliance with organizational SLA policies. They use real-time dashboards and reports to monitor SLA performance, identify recurring issues, and evaluate team efficiency.

Managers also review breach justifications submitted by support agents to ensure that SLA exceptions are properly documented and corrective actions are implemented where necessary.

Responsibilities

- Monitor overall SLA compliance across the organization.
- Review SLA breach reasons and justifications submitted by agents.
- Analyze SLA performance trends using reports and dashboards.
- Track individual and team performance.
- Identify recurring SLA issues and recommend process improvements.
- Ensure governance policies are consistently followed.
- Monitor acknowledgement status and accountability metrics.
- Support decision-making through data-driven insights.

Contribution to the Project

IT Managers ensure operational transparency and governance by monitoring SLA compliance, reviewing documentation quality, and driving continuous improvement in service delivery.

3. ServiceNow Administrator

Overview

The ServiceNow Administrator is responsible for configuring, maintaining, and supporting the technical components of the SLA governance solution. The

administrator implements the system using native ServiceNow capabilities without custom scripting, ensuring that all configurations align with business requirements.

The administrator also manages security, automation, reporting, and the Virtual Agent to ensure smooth system operation.

Responsibilities

- Configure Incident Resolution SLAs.
- Design and maintain Virtual Agent conversation topics.
- Configure Flow Designer workflows for SLA notifications.
- Create and manage UI Policies and Data Policies.
- Configure Role-Based Access Control (RBAC) and Access Control Lists (ACLs).
- Maintain reports, dashboards, and performance analytics.
- Monitor system functionality and resolve configuration issues.
- Ensure governance records remain accurate and audit-ready.
- Perform periodic maintenance and enhancements to the solution.

Contribution to the Project

The ServiceNow Administrator enables the successful operation of the SLA governance system by configuring automation, maintaining security, supporting users, and ensuring that all components function efficiently within the ServiceNow platform.

Stakeholder Collaboration

The effectiveness of the SLA governance solution depends on the coordinated efforts of all stakeholders.

- **IT Support Agents** respond to SLA alerts, interact with the Virtual Agent, and provide accurate breach documentation.
- **IT Managers** monitor compliance, review governance records, and evaluate team performance through reports and dashboards.
- **ServiceNow Administrators** configure and maintain the system, ensuring reliable automation, secure access, and accurate reporting.

This collaboration creates a proactive governance framework that minimizes SLA violations, strengthens accountability, improves operational transparency, and maintains audit-ready records.

Conclusion

Clearly defined stakeholder roles and responsibilities are essential for the success of the **Virtual Agent–Driven SLA Breach Awareness & Justification System**. By assigning specific duties to IT Support Agents, IT Managers, and the ServiceNow Administrator, the organization establishes a structured governance model that promotes timely incident resolution, consistent SLA compliance, secure system management, and informed decision-making. Together, these stakeholders ensure the solution delivers improved service quality, enhanced accountability, and long-term operational excellence.
