

Test Case 3 – SLA At Risk Flag Validation

Objective

To verify that the **SLA At Risk** field is updated automatically when the SLA reaches the configured threshold.

Steps

1. Wait until the SLA reaches **80% or more** of its duration.
2. Refresh the Incident record.
3. Verify the **SLA At Risk** field.

Expected Result

- The **SLA At Risk** field is automatically set to **True** when the SLA crosses the 80% threshold.

The screenshot displays the 'Incident' record form for incident number INC0000018. The form is divided into several sections. The top section contains fields for 'Number' (INC0000018), 'Call' (Adt Tdr), 'Category' (Regis / Help), 'Subcategory' (None), 'Service' (None), 'Service offering' (None), 'Configuration item' (WMMC-101), and 'Description' (Testing the port to end use case). The right section contains fields for 'Channel' (None), 'State' (In Progress), 'Impact' (3 - Low), 'Urgency' (3 - Low), 'SLA type' (SLA - Running), 'Assignment group' (None), and 'Assigned to' (David Lee). Below these fields is a 'Related Search Results' section. At the bottom, there is a 'SLA At Risk' field set to 'True'.

Actual Result

The **SLA At Risk** field was automatically updated to **True** after the SLA crossed the configured threshold.
